

HFD 108 FASHION FIGURE DRAWING

ASSIGNMENT GUIDELINE 5 (WK 7/8)

Fabric draping and folds

In fashion illustration, fabric draping and folds are vital for transforming flat sketches into dynamic, three-dimensional designs that realistically interact with the human form. Draping refers to how fabric naturally hangs and flows over the body, while folds are the specific creases created by movement, gravity, and tension points. Lightweight materials like silk or chiffon produce soft, delicate drapes with flowing lines, whereas heavier fabrics like denim or wool create more structured, angular folds. Illustrators use these techniques to convey the weight and texture of a garment, ensuring the design appears lifelike rather than static

- **Pipe Folds:** These are cylindrical, tubular folds that occur when fabric hangs freely from a single point or a bunched area, such as in a skater skirt or curtains

- **Zigzag Folds:** Occur when tubular fabric (like pant legs or sleeves) is compressed, creating alternating [diamond-shaped creases](#) at joints like the [ankles or knees](#).

- **Spiral Folds:** Formed when fabric is twisted or wrapped tightly around a cylindrical form, such as [rolled-up sleeves](#) or fabric stretching around the torso.

- **Half-Lock Folds:** These bold, angular folds appear at bent joints where fabric abruptly changes direction, creating U-shaped creases on the outside of a bend (like a knee or elbow).

- **Diaper Folds:** The classic "U-shape" sag that occurs when fabric is suspended between two tension points, commonly seen in cowls, scarves, or capes.

- **Drop Folds:** Similar to pipe folds but more conic in shape, these occur when fabric falls freely from a single point, like a towel on a hook or a hanging scarf.

- **Inert (or dead) Folds:** These folds occur when fabric is inactive and lying flat on a surface, such as a pile of clothes on the floor, showing no predictable pattern.

Essential Draping Techniques

Draping techniques in fashion range from basic methods for building a garment's foundation to advanced sculptural manipulations used in haute couture. These techniques allow designers to see how fabric reacts to the body in 3D, creating silhouettes that are often impossible to achieve through 2D drafting alone

Pleating: Creating controlled, recurring folds to add structure, texture, and volume. Variations include **sunburst (radiating) pleats** that spread from a single point.

Gathering: Pulling fabric together along a stitch line to create soft, rumpled effects and manageable volume. As shown in figure 1.

Ruching: A more extensive form of gathering, often used across larger surfaces to create controlled movement or highlight specific features like the bustline.

Assignment 1

Create **four (4)** artistic fashion illustrations featuring models wearing garments decorated with the following fabric manipulation techniques: **pleats, gathers, ruffles, and Darts**. Arrange the illustrations so that two are well-balanced on each page. Explore color and rendering techniques such as shading and crosshatching, to achieve a sense of volume.
